Potentiometers

Parts Used In This Step

Quantity	Description
3	10K Ω (ohm) potentiometer

These potentiometers are also known as variable resistors. The Philips head screw terminal on top is used to change the resistance from 0 Ohms to 10,000 (10K) Ohms.

Installation Instructions

1) Populate the three potentiometers into the PCB. Notice that each potentiometer has 3 pins which are offset. They will only insert one way.

After all three potentiometers are populated, flip the board over and bend the pins so that they don't fall out.

IMPORTANT!

Before you begin soldering, make sure you are wearing safety glasses.

3) Solder all of the installed components we just populated.

(Resistors, pushbuttons, potentiometers)

4) Using a pair of quality snippers, cut off the excess wires close to the PCB.

Note- If you don't have a pair of quality snippers, I highly recommend these:
